ACKNOWLEDGMENTS

I would like to express my sincere appreciation to Colonel Edward F. Lynch for his mentorship during my residency year at Darnall Army Community Hospital (DACH). His leadership and management style are highly effective in healthcare organizations and I am most fortunate to have him take the time to pass on some of his skills/experience to me.

To my wife, Mary, and our daughter, April, I wish to convey my thanks for their unwavering support through the didactic and residency phases of the U.S. Army-Baylor Graduate Program in Healthcare Administration.

Abstract

The Assistant Secretary of Defense for Health Affairs has increased the responsibilities of the military treatment facility (MTF) commander with the implementation of the Coordinated Care Program (CCP) initiative. No longer is the MTF commander responsible only for the health care provided at the MTF, but the commander is also responsible for managing the delivery of care to all beneficiaries in the MTF's catchment area. A primary goal under the CCP is that of providing cost-effective health care for the entire beneficiary population. The purpose of this study is to use existing data and establish a methodology for allocating expenses to each diagnosis related group (DRG) at DACH. The DRGs will be assigned a portion of expenses based on FY 92 expenses for the particular clinical service, the number of the inpatient workload units (IWU) produced by the service, and the weight of each DRG. In this way, expenses will be allocated to each DRG. The civilian sector has been using DRGs since 1984 and many of the hospitals identify costs and charges by the DRG. With the methodology provided in this study, the MTF will be able to make more accurate

cost comparison of care by DRG at the MTF with the care provided by civilian providers/organizations in the catchment area. Accurate cost comparisons are critical to the goal of rendering cost-effective care.

INTRODUCTION

Conditions Which Prompted the Study

On 8 January 1992 the Assistant Secretary of Defense for Health Affairs directed that the Coordinated Care Program (CCP) be implemented by all military treatment facilities (MTF). The CCP is the Department of Defense's (DoD) plan for providing the commander of each MTF the ability and flexibility to improve the delivery of health care to DoD eligible beneficiaries. Prior to this DoD initiative, the MTF commander was primarily responsible for managing the services provided at the MTF. If the service was not available at the MTF or if demand exceeded the MTF's capability, beneficiaries were referred to the civilian sector under the Civilian Health and Medical Program for the Uniformed Services (CHAMPUS) program or to another MTF. Under the CCP, the MTF commander is responsible for managing the delivery of care to all beneficiaries in the MTF's catchment area. The MTF commander has now been provided both the MTF budget and the CHAMPUS budget. No longer can the MTF refer patients to the civilian sector without a concern for the cost of the care provided by civilian healthcare

providers. A primary goal of the CCP is to provide cost-effective health care for the beneficiary population by making the commander accountable for the use of all health care dollars in the catchment area.

The commander must manage the funds for the entire catchment area. Civilian hospitals base their charges per DRG. The commander needs to be able to compare military costs with civilian costs. Success in management of the CCP will be facilitated by a system which permits determination of how to render care in the most cost-effective manner. It is necessary for the hospital commander to have a cost per DRG when establishing prices with other hospitals and physicians.

Currently DACH does not use the individual DRG in the analysis of productivity, resource utilization, or strategic planning. The DRG is included as part of the formula for determining the case mix index (CMI) for the hospital and for each clinical service. The hospital CMI is the average of the relative weights assigned to the patient's DRG (Hsia, Krushat, Fagan, Tebbutt & Kusserow, 1988). At DACH the CMI is used for a general assessment of the intensity of services being

performed and not for cost of services. The Chief of Resource Management Division and the Chief of Patient Administrative Division recognize the need for a system which will assign the cost of inpatient workload units by service and also allocate expenses to each DRG based on the service's total expenses. DACH will need more information than the cost per disposition by service in the coordinated care environment to efficiently and effectively manage their MTF and CHAMPUS budgets.

Problem Statement

Under the Coordinated Care Program, the military medical treatment facility is responsible for ensuring that the health care provided to its beneficiary population is accessible, cost-effective, and rendered in a timely manner. It is recognized that this facility cannot provide all of the care required. The demand exceeds Darnall Army Community Hospital's capabilities and the capabilities of other MTFs in the catchment area. The civilian sector must be relied upon to help meet this excess demand. DACH is in the process of establishing a Preferred Provider Network. However, a fundamental requirement prior to negotiating

prices with a Preferred Provider Network is that of knowing how much it costs to provide a service. The civilian sector accounts for their expenses by DRG. DACH does not have a system to account for expenses by DRG.

The problem statement: How can expenses be allocated to each DRG at Darnall Army Community Hospital?

Literature Review

Since the beginning of the Medicare Program in 1965, hospital costs increased from \$28 billion to \$147.2 billion in 1982 (in real dollars) for all patients. Public Law 98-21 was passed by the Congress in 1982 as part of the Tax Equity and Fiscal Responsibility Act. Public Law 98-21 was established to help control health care costs by establishing prospective reimbursement rates for Medicare patients based upon the diagnosis related groups (DRGs). Prior to the implementation of DRGs, the health care industry did not use cost accounting (Diomedes, 1985) because hospitals were reimbursed on a full-cost retrospective basis. Full-cost retrospective reimbursement resulted

in hospitals being reimbursed for all costs no matter how inefficient (Putman, Rayburn, and Rayburn, 1991). The federal government is not the only payer today using prospective payment. At least ten Blue Cross and a dozen Medicaid programs are using prospective payment or have announced plans to do so (Farley and Hogan, 1990). Blue Cross/Blue Shield of Texas recently announced that it would be implementing a prospective payment system based upon DRGs for all Blue Cross/Blue Shield insured patients (Devine, 1993).

The DRG is a patient classification system which was developed in the 1970s. This is the first practical system of measuring outputs in the health care sector (Hindle & Scuteri, 1988). According to Ziegenfuss (1985), DRGs allowed hospitals to look at their services as products. He further notes that this has changed the hospital's way of thinking, from service-orientation to a business-orientation.

Initially there were 467 DRGs based on diagnoses and treatment patterns (Putman et. al, 1991). The weight assigned to each DRG is based on the principal diagnosis, operative procedure, complications or additional diseases, age and discharge status of the

patient. The DRG weight is an attempt to predict resource consumption (Munoz, Friedman, Schroder, Gross, Goldstein, & Wise, 1988) and used to determine a prospective payment for treatment provided to the patient. With fixed payment for each DRG, hospitals either make a profit or loss based on the hospital's efficiency or inefficiency (Putman, et. al., 1991). The prospective payment system has forced hospitals to develop budgets based on actual costs of DRGs and prospective payment of the DRGs (Soliman and Hughes, 1983). The costs of care must be identified in order to determine the opportunity cost of decisions. What is it we are giving up to pursue another goal? (Hall and Mooney, 1990). The economic changes in medicine require that the costs of medical care be identified so the available resources are allocated in a prudent manner. Under the prospective payment system, hospitals must control costs. The cost of care must be accounted for before it can be controlled. (Conn, Raymond, Aller, and Lundberg, 1985).

Prospective payment and the competition of health maintenance organizations and preferred provider organizations have increased the price competitiveness

of hospital services (Farley and Hogan, 1990). In order to be competitive, the hospital must first have a good understanding of cost analysis before determining prices (Heshmat, 1991). Cost accounting is the system of assigning costs to the purpose for which the costs were incurred (Diomedes, 1985). It is not a new system and has been used for over 50 years (Hindle & Scuteri, 1988). The full cost of a product is a financial measurement of all resources (direct and a portion of indirect) used and assigned to that product (Broyles and Rosko, 1986).

One survey revealed that 54% of 3,100 hospitals surveyed had a system in place to account for costs by each DRG. Most of the systems in place are unsophisticated and need to be improved (Putman et. al, 1991). According to Conn et. al. (1985), the successful hospitals will be those hospitals with the best information on their costs. Hospitals negotiating contracts with preferred payers need reliable cost estimates (Grimaldi, 1984). Under the prospective payment system, it is critical for the hospital to efficiently account for the mix of cases (DRGs) and manage these cases. A hospital cannot stay financially

viable if the case mix is dominated by DRGs which cost the hospital more than they are reimbursed (losers). Identification of DRG losers allows the hospital to conduct an assessment of its process for that particular DRG. This identification and assessment is essential to minimizing losses (Kazahaya and Masters, 1988). A hospital can protect itself from overall financial losses if payment across all DRGs exceeds total costs (Jencks and Dobson, 1987). DRGs generate data that is both financial and clinical. Hospitals will be compared against each other by payers of health care based on this information. Hospitals must incorporate the DRG into their strategic planning and objectives. What they do well or not so well must be addressed by hospitals and plans implemented to overcome shortcomings. The DRG allows the hospital to establish its goals and objectives by product line. DRGs allow the hospital to measure, compare, control, and adjust the product lines (Ziegenfuss, 1985).

Purpose

The purpose of this study is to use existing data and establish a methodology for allocating expenses to

each DRG at DACH. All DRGs for a service will be allocated a portion of each clinical service's expenses based on the DRG weight and the cost of the service inpatient workload unit. The Medical Expense Performance Reporting System (MEPRS) will be the source for expense data. Using FY 92 data, the objectives of this study will be to determine the cost of producing a hospital inpatient workload unit (IWU), the cost of each specific clinical service IWU, and allocating expenses to each DRG.

METHODS AND PROCEDURES

MEPRS provides a breakdown of all expenses for inpatient and outpatient care by clinical service. The MEPRS system is an automated system of accounting for all expenses incurred by the hospital. The "step down" method is used to allocate all expenses to the different clinical services. The cost of providing inpatient care was obtained from part one of the detailed medical expense and performance report for FY 92 (Appendix A). The MEPRS data and the case mix index for each service will be used to determine the cost of an inpatient workload unit by service.

The Special Studies Branch, U.S. Army Patient Administrative System and Biostatistics Activity (PASBA) provided the case mix index (CMI) for each service (Appendix B). A CMI is the DRG average (adding all DRG weights together and dividing it by the number of DRGs). The hospital's CMI is the average weight of all DRGs. The CMI of each clinical service is the DRG average-weight for the specific service.

The IWU is the relative weighted product of all DRGs. The IWU is used by the Army to place workload into measurable units based upon DRGs. The number of IWUs produced is determined by adding the weight of each DRG or by multiplying the case mix index by the number of dispositions.

Case Mix Index * Dispositions = Inpatient Workload Unit

For example, Darnall Army Community Hospital has a CMI of .6428 and 16,217 dispositions. Thus, $.6428 * 16,217 = 10,242.4$ IWUs. The sum of all DRGs produced at DACH is 10,242.4. To determine the number of IWUs produced in a service, one would multiply the specific service CMI by the number of dispositions in that

service or determine the sum of all DRGS. An example to depict the relationship between DRG weights, dispositions, CMI, and IWUs is provided at Figure 1 (Appendix C).

Insert Figure 1
HERE

The cost per IWU is determined by dividing the total inpatient expenses for the hospital by the total IWUs. During FY 92, Darnall Army Community Hospital's total expenses for inpatient care was \$31,103,808; the cost per IWU was \$2,983.75. The cost per IWU for each service at Darnall Army Community Hospital is derived in the same manner using specific service IWUs and expenses. It must be noted that the number of dispositions in MEPRS and the number of dispositions from PASBA did not match at the time this study was written. Due to the processing time required for encoding records at DACH and transmitting the data to PASBA, one can expect a difference between the two databases. The MEPRS data base has 16,205 dispositions where as PASBA data base has 16,217. The difference between MEPRS and PASBA data is not

significant, for it only involves 12 dispositions. The CMI and IWU for each service is based on PASBA data. This study is based on PASBA data for the number of dispositions.

The cost of the service IWU can be compared to the cost of the hospital IWU. If you take the cost of a service IWU and divide it by the cost of the hospital IWU, you obtain the service's IWU weight relative to the hospital IWU. For example, the pediatrics IWU cost is \$2355.58 then its weight (relative to the DACH IWU) would be .77. In comparing pediatrics' IWU weight of .77 to its CMI of .7405, it is recognized that its CMI is reflective of its IWU costs.

To allocate expenses per DRG, one should use the cost per IWU for the specific service as the base multiplier. For example, DRG 373 (Vaginal Delivery w/o complications) has a DRG weight of .3182. One will obtain two different results by multiplying the DRG weight by the hospital IWU cost in comparison to the obstetrics IWU cost.

DRG wgt * Hospital IWU\$ - .3182 * \$2983.75 - \$ 949.43

DRG wgt * Service IWU\$ - .3182 * \$3268.40 - \$1,040.00

This example demonstrates that DRG 373 results in a slight cost difference of \$90.57, depending on the IWU cost used as a base multiplier. During FY 1992, DACH conducted 1,715 procedures which were coded as DRG 373 in the Obstetrics Service. This slight difference totals to \$155,327.55 for the year.

The IWU cost for each service will be determined by dividing the total number of IWUs for a service into the total expenses for the service. The PASBA Special Studies Branch also provided a listing of all DRGs per service for DACH during FY 92. Each service's total inpatient care expenses will then be allocated per DRG.

Validity and Reliability

The study conducted by Hsia et. al (1988) showed a 20.8 percent error-rate in the DRG assigned to records of discharged patients. More recently it has been reported that the error-rate for diagnosis-related group coding has decreased to 14.7 percent (TxHIMA Newsletter, 1992). At DACH all newly assigned analysts are placed in a training program. While in the training program, all records encoded by the analyst are reviewed for accuracy by a senior analyst. Newly

assigned analysts must demonstrate the ability to encode records accurately for three consecutive months before being allowed to encode records without each record being reviewed. The senior analyst reviews each analyst's records at least one day each month and reviews all records encoded by the analysts during that day. This review process is unannounced. The error rate for encoding records at DACH is 6 percent. Analysts exceeding a 6 percent error rate are more closely monitored by the senior analyst.

All data used for this study is secondary data collected in accordance with the guidance outlined in DoD instruction 6010.13-M, AR 40-66, and AR 40-400, and therefore assumed to be both reliable and valid. Ethical rights were considered in that the data used for the research did not identify specific persons, divulge confidentiality, pertain to sensitive privacy act material, or use human or animal subjects.

RESULTS

The cost of the hospital IWU and each clinical service IWU was determined based upon FY 92 expenses. Using each clinical service IWU cost, all expenses have

been allocated to each DRG. These results are at Appendix D. Part one of Appendix D lists all clinical services, their IWU cost, and the relative weight of the service's IWU cost to the hospital IWU cost (DACH DRG Wgt) as determined in this study. Part two of Appendix D is the actual allocation of expenses to each DRG for all clinical services at DACH.

DISCUSSION

The Coordinated Care Program is DoD's attempt to ensure cost-effective care is provided to its beneficiaries within the MTF and by civilian healthcare facilities. Central to the Coordinated Care Program is the establishment of "arrangements between military and civilian health care providers and organizations" (Assistant Secretary of Defense (Health Affairs), 1992, p. 2). DACH has developed a Preferred Provider Network plan which identifies the services the MTF will require from the local community. In the coordinated care environment, it is necessary for military hospitals to be able to determine their own costs in order to make comparisons with the civilian sector prior to entering into arrangements.

Prior to this study, the financial information available at DACH concerning inpatient care was limited to the average cost per disposition for each service. The decisions required under the Coordinated Care Program should not be based upon average costs. In order to make decisions about specific product lines (DRGs), DACH must have an estimate of the costs associated with each product. Managers cannot control expenses or make sound financial decisions unless they know the expenses associated with producing the products.

The relative weight of the service IWU cost to the hospital IWU cost, as determined in Part I Appendix D, provides DACH the information needed to initially identify potential financial problem or success areas (losers and winners). For example in Internal Medicine, the CMI is .8564 and the DACH DRG weight is .85 which shows that the amount of funding provided to this service is reflective of its CMI. On the other hand, in Psychiatry Service the DACH DRG weight is 2.42 and the CMI is .756. A CMI of .756 should require \$2,255.15 to produce one IWU, not \$7,223.59 as is currently the case in the Psychiatry Service. It is

also noted that the CMI in Pulmonary (1.356) and Allergy (1.0654) are substantially above the DACH DRG weight of .39 and .15 respectively. It appears that the costs associated with the pulmonary and allergy patients are not being accounted for correctly in MEPRS. The DACH DRG weight compared to the service CMI enables managers to identify which services have a CMI that exceeds, is below, or is reflective of cost.

Part II of Appendix D is the actual allocation of expenses to the DRGs for each clinical service. The allocation of expenses to DRGs provides managers with an estimate of the cost for rendering specific DRGs in each service. Appendix E provides the 1992 Health Care and Financing Administrations listing of all DRGs for reference purposes. This portion of Appendix D allows managers to review each services' outputs (DRGs). For example, a review of Oral Surgery shows that DRG 63 and DRG 187 represent 38% of the dispositions and 50% of expenses. This information identifies two products which require 50% of the resources used in the service. Managers can now concentrate their efforts on ensuring that these two products (DRGs) are rendered in the most cost-effective manner, rather than trying to analyze

all 28 DRGs in the service.

The allocation of expenses to DRGs provides management a tool for comparing the estimated cost of inpatient services, by product line, to prices charged by civilian healthcare facilities. This information will enhance the decisions made at DACH as to which products would be provided at DACH or by civilian facilities in the most cost-efficient manner. A comparison of a few DRGs helps to demonstrate the importance of this concept. The following cost comparison has been made with whole dollars. The Financial Automated Support System (FASS) provides DACH with the financial information on all CHAMPUS claims processed within DACH's catchment area. The FASS shows that during FY 92, the average cost to the Federal Government for DRG 370 (cesarean section with complications) was \$5,533 and DRG 373 (vaginal delivery without complications) was \$2,639. The data at Appendix D shows DRG 370 and DRG 373 with an average expense of \$3,329 and \$1,031 respectively. This comparison demonstrates that DACH produces DRG 370 and DRG 373 at a possible cost savings of \$2,204 and \$1,608, respectively. In FY 92 there were 136 vaginal

deliveries without complications (DRG 373) in DACH's catchment area requiring CHAMPUS funding. This information provides DACH the initial information vital to a feasibility study on increasing production of DRG 373.

It must be stressed that Part II of Appendix D is an allocation of known expenses to DRGs based upon the individual DRG weight, and the dollar figure for each DRG is not the cost per DRG. The DRG weights are recalculated each year by the Health Care Financing Administration so that the weights are reflective of current resource intensity for inpatient care (Price, 1989).

CONCLUSIONS AND RECOMMENDATIONS

This study has provided DACH with a methodology for allocating inpatient expenses to DRGs in each service. This study brings together financial information from the Resource Management Division and patient data from the Patient Administrative Division. The combination of this information presents management with a tool for budgeting and enhancing the decision making process in the Coordinated Care Program.

The comparison of the service CMI and the DACH DRG weight should assist management with the identification of services that are efficient, inefficient, or identify potential problems with the MEPRS system for that particular service. After the initial identification, management can take steps to determine the reasons for expenses that exceed what the CMI suggests. It appears that some services are requiring more resources than the CMI for the service warrants. In such instances, the costs being assigned to the service by MEPRS may need to be reviewed, the encoding of the records may be a problem, or there may be reasons unique to the military system which may require more resources than the DRG weight indicates.

The allocated expenses per DRG should be a valuable tool to the Chief of Coordinated Care, Chief of Resource Management Division, and to each Service Chief for managerial decisions. The allocation of expenses, for the most current year, provides management with a quick estimate of the costs associated with producing a given product. With this information, management will be able to determine the feasibility of increasing, decreasing, or contracting

out certain products.

It is recommended that DACH continue to update Appendix D on an annual basis and provide managers with their portion of Appendix D. The spreadsheets have been established and it is now a matter of updating the spreadsheets once a year with the MEPRS and PASBA data.

The military decision makers must have costs that are more reflective of actual costs for each DRG. Unless the Department of Defense becomes more cost-effective, the managing editor of Modern Healthcare may be correct in her assessment of military officers. "putting military officers in charge of the coordinated-care program and expecting a cost-effective operation seems a little like expecting Madonna to sing chastely sung ballads at her concerts" (Petitte, p. 22, 1992).
